This system, termed energy dependent non-radiative energy dissipation or non-photochemical fluorescence quenching, reduces the quantum efficiency of photosystem II (PSII), helping to prevent PSII over reduction and photoinhibitory damage. The amino acid sequence of the VDE was deduced from an isolated cDNA clone (AAT66243). VDE nucleic acids (see also AAT66241-42), in sense or misense orientation, can be used in genetic constructs to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or collective ficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          951 MAVATHCFTSPCHDRIRFFSSDDGIGRLGITRKRINGTFLLKILPPIQSADLRTTGGRSS 1010

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-JUN-1999
```

```
The present sequence is a MIM protein from Arabidopsis thaliana, which contributes to recombination repair of DNA damage in plant cells. The protein was tracked down with the help of a T-DNA tagged Arabidopsis mutant showing hypersensitivity to methyl methanesulphonate (MMS). It shows homology to a member of SMC (Structural Maintenance of Chromosomes) protein family and confers hypersensitivity to treatment with MMS, X-rays, UV light or mitomycin C. The present sequence is useful for DNA repair in plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /label= DA-box

pre-erythrocytic liver stage antigen. 3 (LSA-3) protein. The encoding gene sequence was isolated by screening a P. falciparum strain T9/96 library with serum from a missionary treated by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones isolated, clone 7295 was used to screen a library generated from Thai strain K1. One clone contained 6.85 kb insert including the genomic sequence AAT/8867. The gene comprises a 1.8 kb region encoding 3 major blocks of tetrapeptide repeats (especially the amino acid sequence VEES, VEEN, VEEI, VAPE, etc.) and a 3' hydrophobic region corresponding to a glycosyl-phosphatidyl- inositol membrane anchoring sequence. The inositol membrane anchoring sequence. The firm the LSA-3 protein with the exception of the peptides AWW24/91-4. The LSA-3 peptides can be used to raise antibodies and as vaccines for

```
the mammalian mitosin. Mitosin is involved in the regulation of the mammalian mitotic cell cycle. Mitosin as with EZF-1 (see AAR72824) interacts with the retinoblastoma tumour suppressor gene product). Mitosin is first synthesised at the G1/S boundary, it is then phosphorylated from S through M phase, and during mitosis, is closely associated with the centromeres/Kinetochores at the mitotic spindle poles. Mitosin is necessary for a cell to advance on to the next stage. Mitosin is thus necessary for a cell to advance on to the next stage. Mitosin is thus useful for ocntrolling cell growth as overexpression of mitosin prevents cell from exiting the M phase.

The mati-mitosin antibody antibody fragment or a phosphorylated mitosin mutein (or nucleic acid encoding it) can also be used to inhibit cell division which is particularly useful for the study of the cell cycle. A further use is to control hyperpolificative cells, and so control diseases such as psoriasis and breast cancer. It can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      90;

also necessary for the cell to advance into the next stages of mitosis.

The mitosin protein, can be used to control the growth of cells. An anti-mitosin antibody, a muturn or a non-functional analogue of mitosin can inhibit the mitotic cell cycle by preventing the cells from entering the M phase, and over expression of mitosin or its functional equivalent, would inhibit the cycle by preventing cells from leaving the M phase. Antagonists to this protein can be used to control hyperproliferative cells in, (e.g. thyroid hyperplasia, Grave's disease, psoriasis, benign prostatic hypertrophy, Li-Fraumeni syndrome, breast cancer, sarcomas and other neoplasms, bladder cancer, colon cancer, cancer, sarcomas and other neoplasms, bladder cancer, colon cancer, cupplementation of lost mitosin function by introduction of the protein or nucleic acid encoding the protein into a cell can restore defective chromosome segregation, which is a marker of progressing malignancy. Malignant proliferation of cells can then be halted. The protein can also be used for the detection and diagnosis of hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           90;

Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection -
```

Disclosure; Page 410-414; 577pp; English.

by chromosome 2 of the human malarial parasite, the parameter of the human malarial parasite, the processing and the parasite in the coding (1); and (2) vaccines against P. falciparum infection comprising (1) or (II).

1. and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (1), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rights or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in nection of the plasmodium encomesome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the subsequent identification of proteins encoded by it will help to complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to ABB1832 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. The present invention describes proteins and their fragments (I) encoded

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NAME: Sholtz, Charles K.
REGISTATION NUMBER: 38,615
REFERENCE/PLOCKET NUMBER: 4600-0111.30
TELEPHONE: (415) 324-0860
INFORMATION FOR SEQ ID NO: 51:
SEQUENCE CHARACTERISTICS:
LENGTH: 1312 amino acids
                                                              APPLICANT: Gregory Dolganov
APPLICANT: Gregory Dolganov
TITLE OF INVENTION: Human RAD50 Gene and M
NUMBER OF SEQUENCES: 175
CORRESPONDENCE ADDRESS:
ADDRESSEE: Dehlinger & Associates
STREET: 350 Cambridge Avenue, Suite 250
                                                                                                                                                                                                                                                                                                                                                                                                                                                       APPLICATION NUMBER: US/08/687,080
FILING DATE: 17-JUL-1996
CLASSIFICATION: 435
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/592,126
FILING DATE: 26-JAN-1996
ATTORNEY AGENT INFORMATION:
                   Sequence 51, Application US/08687080 Patent No. 5965427
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TYPE: amino acid

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 1 103750
violaxanthin de-epoxidase precursor - common tobacco
C; Species: Nicotiana tabacum (common tobacco)
C;Date: 24-Mar-1999 #sequence_revision 24-Mar-1999 #text_change 21-Jul-2000 C:Accession: T03750
R; Buqos, R.C.; Hieber, A.D.; Yamamoto, H.Y.
J. Biol. Chem. 273, 15321-15324, 1998
A; Title: Xanthophyll cycle enzymes are members of the lipocalin family, the firm
A;Reference number: Z15054; MUID:98288256 A;Accession: T03750
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-478 <bug></bug>
A; Cross-references: EMBL: U34817; NID:q1463122; PIDN: AAC50031.1; PID:q1463123
A; Experimental source: strain Xanthi; tissue-type leaf
C;Genetics:
A; Gene: TVDE1
C; Function:
A; Description: violaxanthin de-epoxidase and zeaxanthin epoxidase catalyze the
d in protecting the photosynthetic apparatus from excessive light
A; Note: established as member of the lipocalin family
F;1-134/Domain: transit peptide (plastid) #status predicted <tnp></tnp>
F;135-478/Product: violaxanthin de-epoxidase #status predicted <mat></mat>

-!- FUNCTION: MUSCLE CONTRACTION.
-!- SUBDINIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2
-!- SUBDINIT: MUSCLE MYOSIN IS A HEXALI LIGHT CHAIN SUBUNITS (MLC)
AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).
-!- SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.
-!- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING
CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,
CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    :|| : | : | : | : : | : : | : : | : : | : : | : : | 1185 NIGHELSLLSQALNSKTLPEAVGTSLEQHAAKFSCMFKTLEATWHDHQVDTRTKIDEYI 1244
